

# Poverty regimes and in-work poverty: a European comparative analysis

David Benassi, Università di Milano-Bicocca

Gianluca Busilacchi, Università di Macerata

Matteo Luppi, Istituto Nazionale per l'Analisi delle Politiche Pubbliche (Inapp)

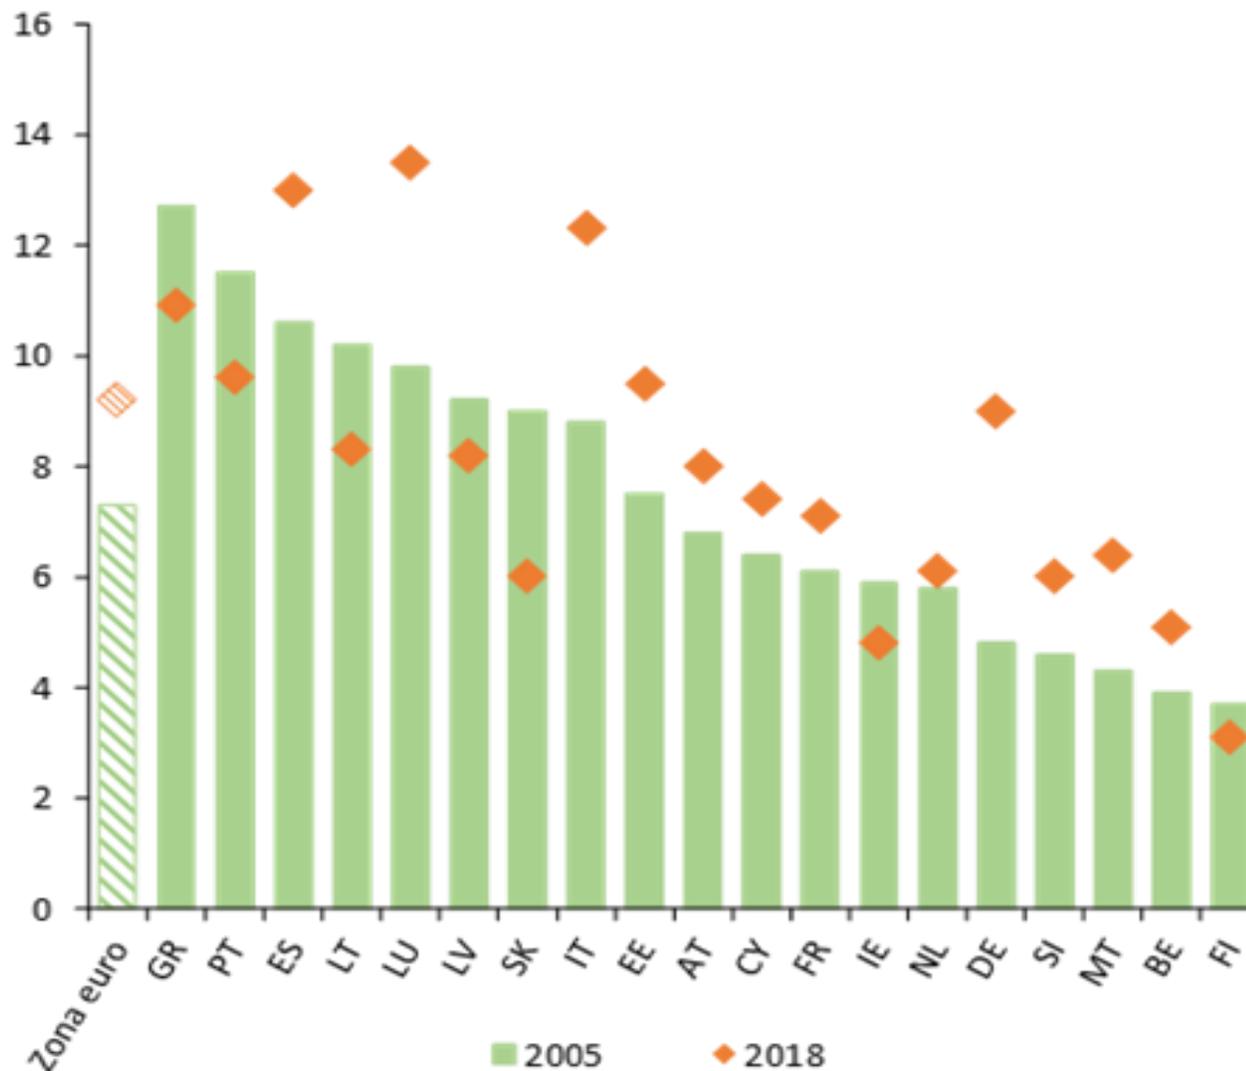

*SISEC, Brescia, 8-11 febbraio 2023*

# Overview

1. Scope, aim, methods
2. Theoretical framework and variables
3. First empirical results

# 1a. Scope

Why is important to analyse and (try to) explain in-work poverty (IWP) nowadays

# 1b. Scope

- IWP (Eurostat): In-work at-risk-of-poverty rate refers to the percentage of persons in the total population who declared to be at work (7 months) and live in a households that are at-risk-of-poverty (i.e. with an equivalised disposable income below the risk-of-poverty threshold, which is set at 60 % of the national median equivalised disposable income, after social transfers).
- difference with the concept of “working poor” and “low-pay worker”
- IWP definition and indicator show a strong connection between individual and household dimensions, between income and work dimensions. Centrality of regulative mechanisms

# 1c. Aim, methods

- To explain IWP there is a need of an analytical framework that considers poverty as the outcome of regulative mechanisms [and cultural processes] (Paugam 2005)
- Aim: testing the capacity of the poverty regimes approach to describe transitions around IWP
- RQ: is the poverty regimes theoretical framework useful to explain IWP transitions in Europe?
- Methods: multivariate analysis (probit models) on EU-SILC data (19 countries, longitudinal wave 2018-19). Focusing on institutional (macro) and household (micro) factors.

The concept of **poverty regime** (Saraceno et al. 2020, 2022) is based on the the concepts of modes of regulation and regulative institutions developed by K. Polanyi (1944).

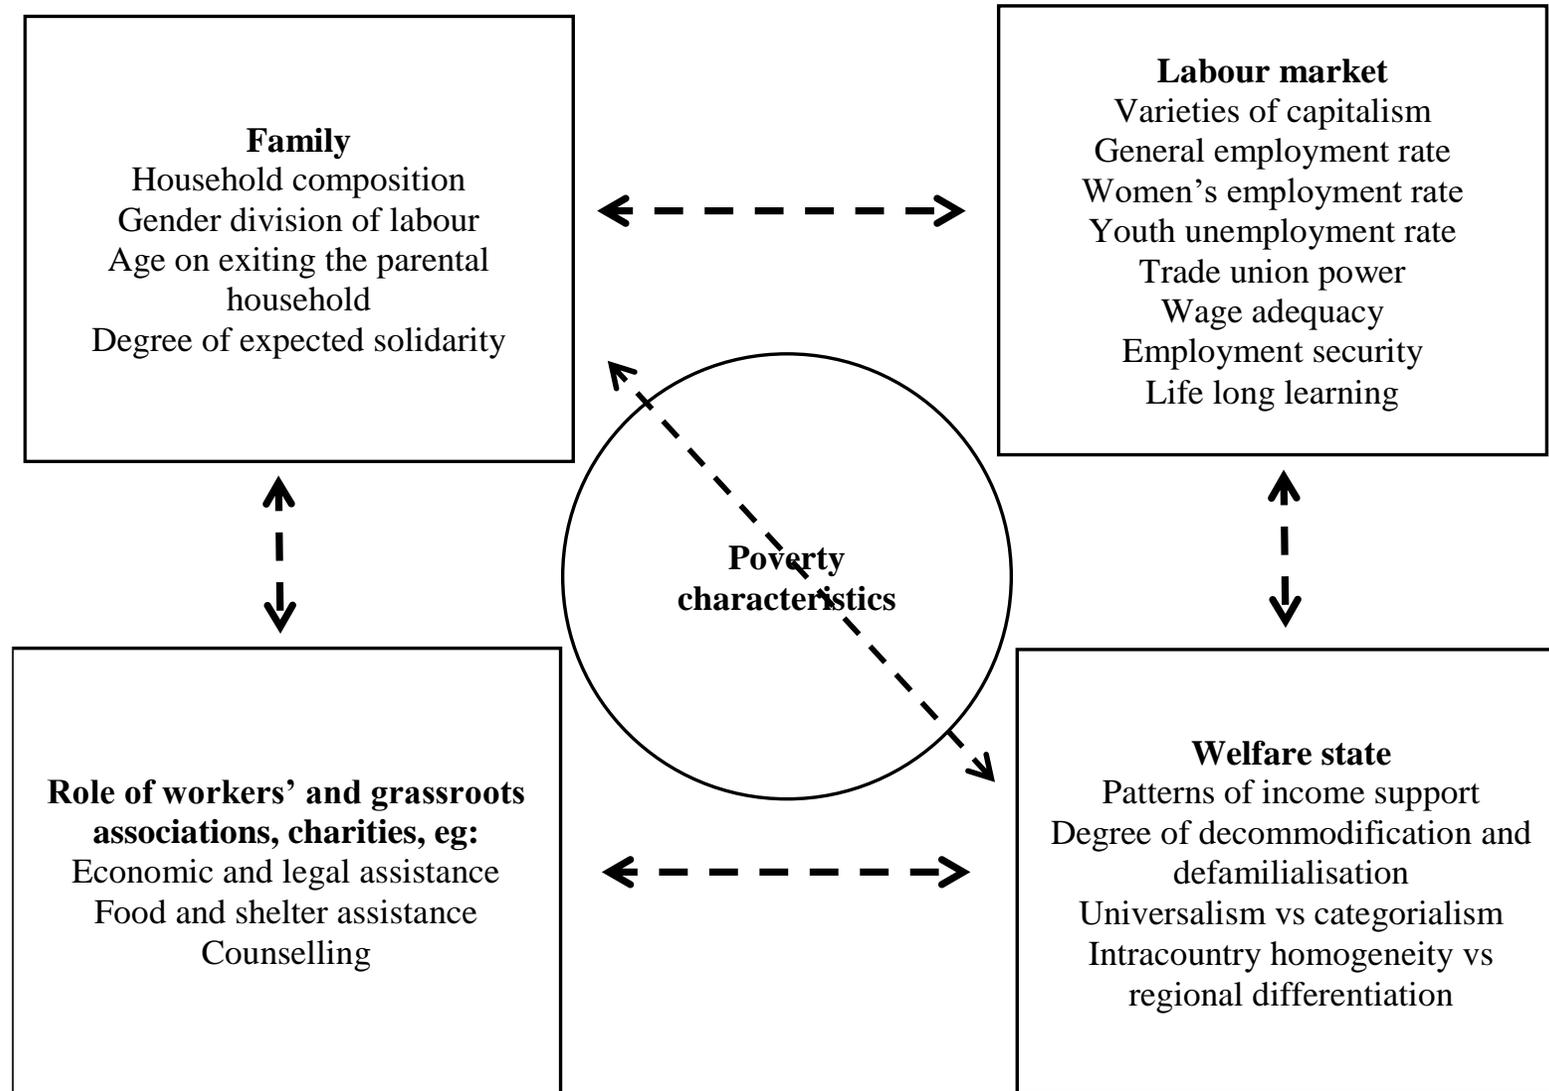

Social regulation of societies is assured by specific institutions (family/parenthood/community; political power; production/exchange of goods and services). Institutions vary in time and space.

**Poverty emerges from these processes of social regulation, which vary in form and extension according to characteristics and combination of regulative institutions**

According to Saraceno et al. (2020, 2022) a **poverty regime** derives from a *specific combination of labour market conditions, balance between public and private (family) responsibility in buffering against social risks, gender division of labour within families and within society, and social norms and cultural values.*

The incidence of poverty, its composition and how it is experienced depend on the peculiar combination and interaction of these factors in a given context and in a given historical period.

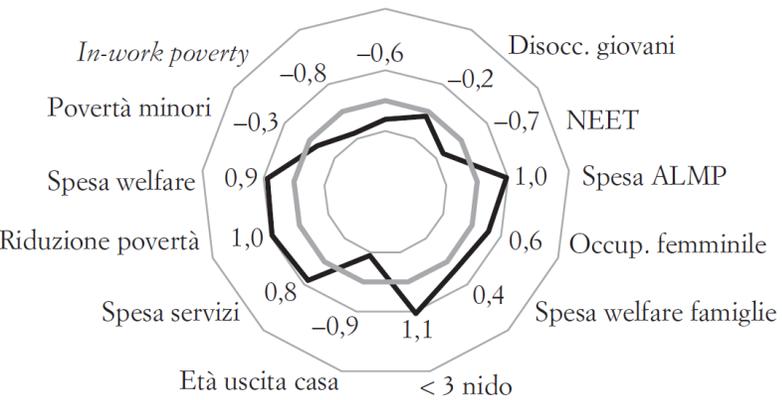

# Poverty regime: the interacting factors

# From macro to micro: first empirical results

## *Empirical strategy:*

- identification and management of data: EU-Silc longitudinal wave 2018-2019 (pre-pandemic crisis)
- identification of households' characteristics (and relative variation between  $t_0$  and  $t_1$ ) influencing transition around IWP
- identification of 11 macro indicators (3 household dimension; 3 labour market dimension; 3 welfare state dimension; 2 structural poverty dimension)
- Empirical analysis: sets of probit models, probability of transit in/out IWP or remain in IWP status across  $t_0$ - $t_1$ ;
- assessing poverty regimes' internal coherency

# From macro to micro: first empirical results

*Empirical strategy:*

$$IWP\_transition_i = \beta X_i + \gamma Z_i + \varepsilon_i,$$

*IWP: three dummy variables identifying the three transition: in, out, stable*

*X is a vector of exogenous covariates at household level*

*Z is a vector of additional covariates at country level*

## Dependent variables descriptive statistics

Poverty regimes	% of households that between 18-19 (17-18):		
	enter in IWP	remain in IWP	exit from IWP

# Predicted probabilities of transition around IWP per country

## Transition toward IWP

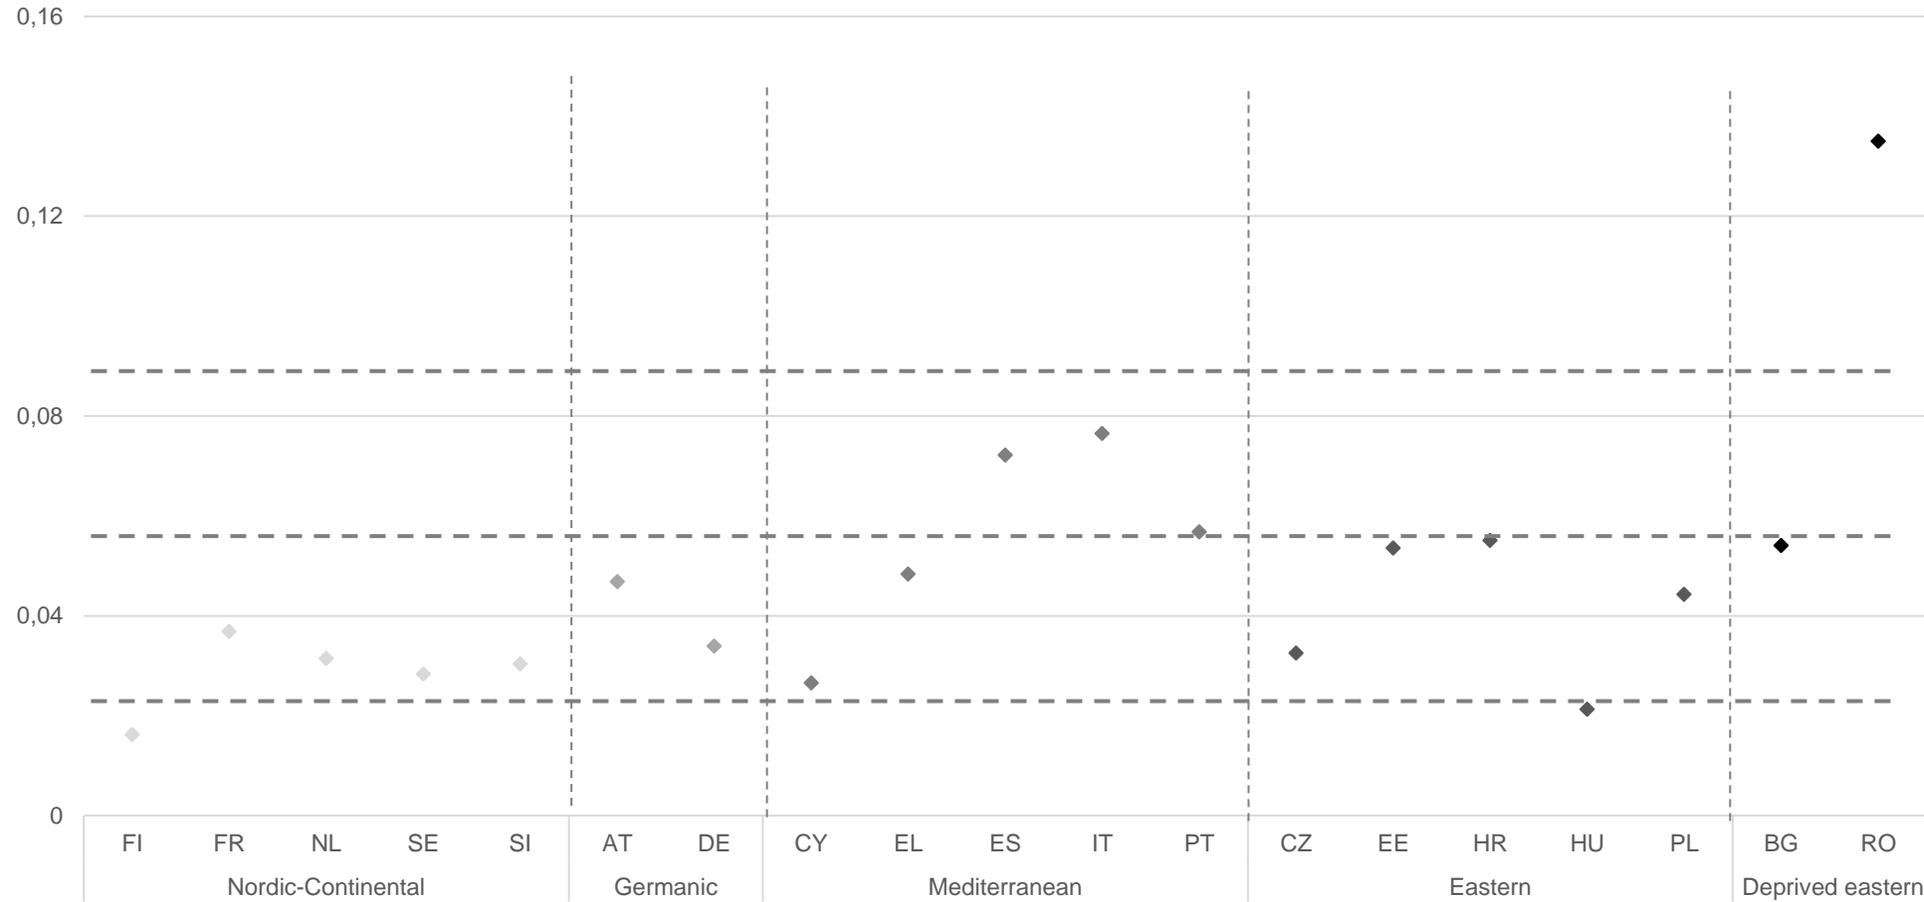

## Transition out of IWP

# Predicted probabilities of transition around IWP per country

## Stable in IWP

# First consideration and next step

- Clearly a working progress but initial double support on poverty regime as analytical category:
  - Poverty regime show consistency, especially in relation to stability in IWP
  - The two sets of models (only micro and micro and institutional) provide similar results.

## *Next steps*

- ***Interaction household#institutional dimensions:***  
*focusing on limited set of country to disentangle the mechanism of interaction between individual/households-institutional characteristics*
- ***Regional macro data:***  
*Building macro indicators at the territorial level (NUTS 2) to better account for countries' internal heterogeneity and understand how household-institutional mechanisms vary within countries.*
